Cervical cancer is the only type of HPV cancer for which there is a recommended screening test.

Screening won’t protect your patients from most cancer caused by HPV infection.

Recommended cancer screening tests are not available yet for other cancers caused by HPV infection.

Cervical cancer is just the tip of the iceberg.

In the United States, 13,000 women are diagnosed with cervical cancer each year.

Screening can detect cervical precancers, which may require additional invasive testing and treatment.

HPV vaccination can prevent most of this.

Screening can detect cervical precancers, which may require additional invasive testing and treatment. HPV vaccination can prevent most of this.

Recommended cancer screening tests are not available yet for other cancers caused by HPV infection.

Don’t rely on screening to catch it later. Protect them now with HPV vaccination.
